

# Reporting as a Service<sup>®</sup>

Why this could be the best option for your client reporting communications

Investment firms should have access to the very best client reporting solution available in order to provide complete, accurate, timely and tailored reporting to their clients. The solution should be flexible, scalable, cost effective, resilient and above all priced and delivered in a way that firms of all sizes can use.

We feel that many existing client reporting solutions are too expensive to implement, especially for medium and smaller sized investment firms. Additionally, the time taken to implement the traditional “buy and build” or “in-house” models is typically measured in months or years – which is far too long if you are trying to improve the client experience and reduce costs.

The Opus Nebula Reporting as a Service<sup>®</sup> solution is a complete end-to-end client reporting solution, it is pre-built and securely hosted in the Microsoft Azure Cloud. It contains all the features you would expect of a truly world-class reporting system, and some that perhaps you hadn't thought of.

On-boarding to Reporting as a Service<sup>®</sup> is measured in weeks, just enough time for us to configure the reports to exactly match your content, layout and branding, to configure our powerful data loaders to import and validate your data, to add your users and teams to the system and finally to configure the automated report distribution. The entire reporting process is controlled and managed by your business users, using simple and straight-forward dashboards.

**Our initial set-up costs are fixed, then you only pay for the reports produced and stored. No more huge project and system costs, these are replaced with a simple tariff with volume discounts.**

## COMMENT

Huge amounts of time, effort and cost are consumed every year in the financial services industry as firms try to build and maintain the same, or very similar, client reporting solutions. This can be inefficient and unnecessary.
